

ABSTRACT

A method for streaming multimedia content in a wireless communication system.

The exemplary method includes receiving, in a data network, a request from a mobile device to stream multimedia content to the mobile device from the data network, where

5 the request is transmitted over a wireless connection. The method further includes streaming a portion of the requested multimedia content from the data network to the mobile device. The method also includes detecting termination of the wireless connection during the streaming and retaining information in at least one of a device in the data network and the mobile device, where the information indicates a point in the

10 multimedia content stream where the termination of the wireless connection occurred. The method still further includes re-establishing the wireless connection and resuming streaming of the multimedia content based on the retained information.
